

Dear (MP, Drs, MHRA, JCVI, Department of Health and Social care as appropriate),

As you are aware, the Pfizer/BioNTech Covid-19 "vaccine", which received regulatory approval in December 2021, will now be "offered" to children in England aged between 5 years old and 11 years old.

The Pfizer/BioNTech Covid-19 "vaccine" is experimental and has only been administered for just over one year to adults and less than a year for young adults and teenagers. Children were excluded from the initial clinical trial; trials are still ongoing and the fatality of SARS CoV-2 infections continues to decline. Young children are not at risk of serious complications or death from Covid-19 however, they are at risk from injury and even death from the Pfizer/BioNTech Covid-19 "vaccine". We have been assured that the clinical trials and the "vaccines" are acutely monitored for safety however, I dispute this. There is overwhelming evidence to justify the immediate halt to the roll out of the Pfizer/BioNTech "vaccine" to 5 to 11 year olds, and to dispose of the Pfizer/BioNTech Covid-19 "vaccine" altogether as it has increasingly become evident that it is the causative agent of numerous adverse events.

I call your attention to the latest data from both the Yellow Card Scheme and the Vaccine Adverse Events Reporting System ("VAERS")(USA) both of which should be forefront in your mind when considering this particular "vaccine" for such a vulnerable population:

VAERS: between mid December 2020 through to March 2022 there have been 1,195,936 adverse events following the Covid-19 "vaccine" including 26,059 deaths reported to VAERS; and

Yellow Card System: up to and including 23rd March 2022 there have been 131,328 suspected adverse reports in England, 8,121 in Wales, 2,982 in Northern Ireland and 12,669 in Scotland relating to the Pfizer/BioNTech COVID-19 "vaccine" (as reported in the "*Coronavirus vaccine - weekly summary of Yellow Card reporting*" updated 31 March 2022).

In addition, the WHO database "VigiAccess" yields 3,155,004 adverse events that were associated with Pfizer/BioNTech and Covid-19 "vaccines" and 15,744 of these events were deaths.

Extensive and compelling evidence shows that Covid-19 poses nearly zero risk to the 5 to 11 years age group:

- data published by the UK Office of National Statistics on January 17th 2022 revealed that from February 2020 through to December 2021 only one child between the ages of 5 and 14 without co-morbidities died from Covid-19;
- a John Hopkins study monitoring 48,000 children diagnosed with Covid-19 showed a zero mortality rate in children under 18 with no co-morbidities;
- a study in Nature demonstrated that children under 18 with no co-morbidities have virtually no risk of death from Covid-19;
- a large study conducted in Germany showed zero deaths for children 5 to 11 years of age and a case fatality rate of three out of a million in children without co-morbidities;
- a further study in Nature from April 2021 suggests children's bodies clear the virus more easily than adults; and
- a study published in December 2021, in Nature, demonstrated how children efficiently mount effective, robust and sustained immune responses to Covid-19.

In addition to the above studies and data, it is also important to consider the pivotal medRxiv pre-print study entitled "*The BNT162b2 mRNA vaccine against SARS-CoV-2 reprograms both the adaptive and innate immune responses*"

([https://www.medrxiv.org/content/](https://www.medrxiv.org/content/10.1101/2021.05.03.21256520v1)

[10.1101/2021.05.03.21256520v1](https://www.medrxiv.org/content/10.1101/2021.05.03.21256520v1)) which illustrates that the Covid-19 "vaccines" are capable of dampening our immune systems to the point of initiating both autoimmunity

and acquired immune deficiency. The innate immune system is extremely powerful in our paediatric population - what will be the effects of this immune system dysregulation? It is your ethical duty to know the answers to this question and to share the answers with parents.

Phase 2 of the Pfizer clinical trial asked the question "*does the treatment work?*" Whilst the Medicines and Healthcare products Regulatory Agency ("MHRA"), the Joint Committee on Vaccination and Immunisation ("JCVI") and the government have consistently claimed that the Pfizer "vaccine" is "safe and effective" the paediatric trials will not be complete until May 2026. There is simply not enough data and the study is not powered enough to support efficacy thus far. Also consider the fact that, since so few children contract symptomatic Covid-19 or end up in hospital **FOR** Covid-19 (rather than **WITH** Covid-19), it is next to impossible to tease out an accurate answer. A more appropriate question would be "*why do we need to "vaccinate" a population with a statistically zero chance of COVID death?*" The JCVI concluded vaccination should go ahead to prevent "*a very small number of children from serious illness and hospitalisation*".

Most recently, the MHRA published "Information for UK recipients on Pfizer/BioNTech Covid-19 vaccine (Regulation 174) (updated 13 April 2022) on the government website which states:

*"This medicinal product has been given authorisation for temporary supply by the UK Department of Health and Social Care and the MHRA. It does not have marketing authorisation, but this temporary authorisation grants permission for the medicine to be used for active immunisation to prevent Covid-19 disease caused by SARS-CoV-2 virus **in individuals aged 12 years of age and over**"* and in addition provides "Package Leaflet: Information for the recipient" which states with respect to children:

"Covid-19 mRNA Vaccines BNT162b2 is not recommended for children under 12 years."

(<https://www.gov.uk/government/publications/regulatory-approval-of-pfizer-biontech-vaccine-for-covid-19/information-for-uk-recipients-on-pfizerbiontech-covid-19-vaccine>)

We do not need any more proof that the Pfizer/BioNTech Covid-19 "vaccine" is not 100% "safe and effective" for our children - to even consider exposing children to a risky and ineffective "vaccine" is unconscionable.

I urge you to educate parents on the true risk to their children of Covid-19 and to do everything in your power to halt the roll out of the Pfizer "vaccine" to 5 to 11 year olds until such time as a comprehensive and independent analysis of the data from Pfizer's clinical trial is made public. This is your ethical responsibility. As illustrated above, the risks of these experimental "vaccines" clearly outweigh the benefits for the paediatric population aged 5 years to 11 years old.

I will leave you with a quote from Dr. Erin Rubin member, FDA Vaccines and Related Biological Products Advisory Committee:

"We're never gonna learn about how safe the vaccine is unless we start giving it. That's just the way it goes."

This statement is, clearly, ethically and morally unacceptable.

Best regards
